Rachael Hernandez (Ph.D., Indiana University Purdue University – Indianapolis)
Communication

Rachael’s research explores communication about sensitive health-related topics. Currently, her research focuses primarily on 1) interpersonal communication surrounding sexual health, and 2) how implicit biases against social groups (e.g. along the lines of race, gender, and age) have the potential to shape physician-patient communication.

Johana Goyes Vallejos (Ph.D., University of Connecticut)
Biological Sciences

Johana’s research interests include sexual selection and mating systems, with a particular interest in species that exhibit parental care behavior. In her research, Johana has used frogs as her study system. For her dissertation work, she focused on elucidating the parental care behavior of the smooth guardian frog of Borneo (Limnonectes palavanensis), an unusual species about which very little was known when she began her work. She is interested in understanding this species’ mating system and what behavioral and ecological factors shaped its evolution.

Merve Fejzula (Ph.D., Cambridge University)
History

Merve’s research is situated at the crossroads of scholarship on African intellectual history, black Atlantic studies, and black internationalism, and adopts an interdisciplinary methodology drawn from anthropology, politics, and literary studies. Merve examines the unknown intellectual history of the Anglophone dissemination of negritude, the movement for race consciousness long associated with the Francophone world. Merve studies the way in which racial belonging was given meaning among African and diasporic subjects during the height of decolonization and desegregation.
